

Did you know that the Playtrains are connected with magnets?
The magnets are strong due to the force of attraction. Let's learn more...

All Magnets have a North Pole and a South Pole, just like the earth. They attract materials which contain Iron, for example paper clips, scissors, screws.

Did you know...

- The earth's magnetic field is 1,000 times weaker than a typical bar magnet.
- The earth's magnetic poles are always moving. The poles move about 5 miles a year.
- Earth, Saturn, Jupiter, Neptune, and Uranus are the only planets in our solar system which have magnetic fields.
- Modern trains use magnets to lift them above the tracks so that they float. Floating reduces friction and allows the train to run more smoothly and efficiently.

How many objects in your house are magnetic?

We think it will be more than you'd imagine! Why not make a list of all the magnetic items that you can find!
